

If you got error like this, after xplugins installation

Open file "...\\TeklaStructures\\2017i\\nt\\bin\\TeklaStructures.exe.config" in any text editor.
Find parameter "loadFromRemoteSources" and set "true"

If "loadFromRemoteSources" line doesn't exist – write it in runtime section (like on picture above).

If file "TeklaStructures.exe.config" doesn't exist – create it and write simple context:

```
<?xml version="1.0"?>
<!-- This file is deployed using the deploy task defined in TeklaStructuresWPF.csproj-->
<configuration>
<runtime>
  <loadFromRemoteSources enabled="true"/>
</runtime>
<startup>
<supportedRuntime version="v4.0" />
</startup>
</configuration>
```

Restart Tekla Structures
